

FX1-拉氏变换

2025年11月25日

16:23

一 拉氏变换的定义

$$\textcircled{1} \bar{f}(s) = \int_0^{\infty} f(t) \cdot e^{-ts} dt$$

$$\textcircled{2} L[f(t)] = \bar{f}(s)$$

$$\textcircled{3} L^{-1}[\bar{f}(s)] = f(t)$$

④ f 关于时间是 t 的函数

⑤ s 关于复变量 s 的函数

拉变

反拉变

t : 常数: 0, 1, 2, 3, 4, 5

s : 复数: $a + bj$

二 基本函数的拉氏变换

$$\textcircled{1} \text{单位冲信号 } f(t) = \delta(t) \quad \bar{f}(s) = 1$$

$$L[f(t)] = L[\delta(t)] = \bar{f}(s) = 1$$

$$\textcircled{2} \text{阶跃信号 } f(t) = 1(t) \quad \bar{f}(s) = \frac{1}{s}$$

$$1) L[f(t)] = L[1(t)] = \bar{f}(s) = \frac{1}{s}$$

$$2) f(t) = \begin{cases} 1 & t > 0 \\ 0 & t < 0 \end{cases}$$

跳变 $t=0$ 不确定看题目规定!!

3) $f(t) = 1(t)$ 本质是 1. $f(t) = 1(t) = 1$. 关于时间 t 函数

$$4) \bar{f}(s) = \int_0^{\infty} f(t) \cdot e^{-ts} dt = \int_0^{\infty} 1 \cdot e^{-ts} dt = \frac{1}{s} \int_0^{\infty} e^{-ts} dt = \frac{1}{s}$$

$$\textcircled{3} \text{斜坡信号 } f(t) = t \quad \bar{f}(s) = \frac{1}{s^2}$$

$$\textcircled{4} \text{单位加速度信号 } f(t) = \frac{1}{2} t^2 \quad \bar{f}(s) = \frac{1}{s^3}$$

$$\textcircled{5} \text{幂信号 } f(t) = t^n \quad \bar{f}(s) = \frac{n!}{s^{n+1}}$$

$$\text{例: } f(t) = t^3 \rightarrow \bar{f}(s) = \frac{3!}{s^{3+1}} = \frac{3!}{s^4} = \frac{6}{s^4}$$

$$L^{-1}\left[\frac{9}{s^5}\right] \rightarrow L^{-1}\left[\frac{4!}{s^5} \cdot \frac{9}{4!}\right] = \frac{9}{4!} L^{-1}\left[\frac{4!}{s^5}\right] = \frac{9}{4!} t^4$$

$$\textcircled{6} \text{幂信号 2 } f(t) = e^{at} \cos \omega t \quad \bar{f}(s) = \frac{s}{s^2 + \omega^2}$$

$$\text{例 } f(t) = e^{\pi t} \rightarrow \bar{f}(s) = \frac{1}{s - \pi}$$

$$f(t) = e^{-\pi t} \rightarrow \bar{f}(s) = \frac{1}{s - (-\pi)} = \frac{1}{s + \pi}$$

$$\textcircled{7} \text{正弦 } 1) f(t) = \sin \omega t \quad \bar{f}(s) = \frac{\omega}{s^2 + \omega^2}$$

$$2) f(t) = \cos \omega t \quad \bar{f}(s) = \frac{s}{s^2 + \omega^2}$$

口诀: 不缺少 ω . 缺 s 与 s

$$\text{例 } L[\cos \omega t] \rightarrow \frac{s}{s^2 + \omega^2} \quad \omega = s$$

$$L[\sin \omega t] \rightarrow \frac{\omega}{s^2 + \omega^2} \quad \omega = s$$

$$\mathcal{L}[\sin t] \rightarrow \frac{s}{s^2 + 2s} \quad w=s$$

$$\mathcal{L}^{-1}\left[\frac{s}{s^2+17}\right] \rightarrow \mathcal{L}^{-1}\left[\frac{s}{s^2+(\sqrt{17})^2}\right] = \cos \sqrt{17} t.$$

$$\mathcal{L}^{-1}\left[\frac{s}{s^2+1}\right] \rightarrow \mathcal{L}^{-1}\left[\frac{\sqrt{1}}{s^2+(\sqrt{1})^2} \times \frac{s}{\sqrt{1}}\right] = \sin \sqrt{1} t \cdot \frac{s}{\sqrt{1}}$$

④例题

1) $\mathcal{L}\{-3\sinh 2t + 2\cos 3t\}$

解: $= (-3 \frac{2}{s^2+4}) + (2 \frac{s}{s^2+9})$

2) $\mathcal{L}^{-1}\left\{\frac{s+6}{s^2+9}\right\}$ 公式: $\sin wt \rightarrow \frac{w}{s^2+w^2}$ $\cos wt \rightarrow \frac{s}{s^2+w^2}$

解: $\frac{s}{s^2+9} + \frac{6}{s^2+9} = \frac{s}{s^2+9} + \frac{3}{s^2+9} \cdot 2$

$\therefore = \cos 3t + 2\sin 3t$

3) $\mathcal{L}\{3\cos 5t + 2\sinh 3t + e^{-2t} + 2\delta(t) + t^5\}$

$= 3 \cdot \frac{s}{s^2+25} + 2 \frac{3}{s^2+9} + \frac{1}{s+2} + 2 + \frac{s^5}{s^6}$

$e^{at} \rightarrow \frac{1}{s-a}$ $\delta(t) \rightarrow 1$ $t^n \rightarrow \frac{n!}{s^{n+1}}$

4) $\mathcal{L}^{-1}\left\{\frac{2s}{s^2+16} + \frac{2}{s^2+16} + \frac{4}{s+3} + 7 + \frac{3}{s^5}\right\}$

$= 2 \cos 4t + \frac{1}{2} \sin 4t + 4e^{-3t} + 7\delta(t) + t^4 \cdot \frac{1}{8}$

$e^{at} \rightarrow \frac{1}{s-a}$ $t^n = \frac{n!}{s^{n+1}}$ $4 \times 3 \times 2 = 24 : 3$
